EBI's Bio Filter 3

This is how your filter setting should look.

This is what's in your package when the filter comes with a new fountain.

The black foam holds the carbon in place and eliminates carbon dust buildup.

To prepare or clean the filter, remove the black foam pads from the housing and cap.

Replace them after cleaning as shown in the pictures below. Make sure the cutouts in the foam align with the tube outlets to ensure steady water flow for many days.

With your foam pads and tubing in place, fill the filter housing with 40 cc (approximately 1/6 cup) of activated carbon pellets. Rinse the carbon before filling your filter to remove possible dust.

If you haven't connected the tubing yet, do it now. Next, place the filter and pump into the fountain bowl, and then connect the tube from the filter housing to the fountain lid.
