

Ebi's Reusable Bio Filter type 2

1. Open the filter housing and remove the seal ring and top sieve.

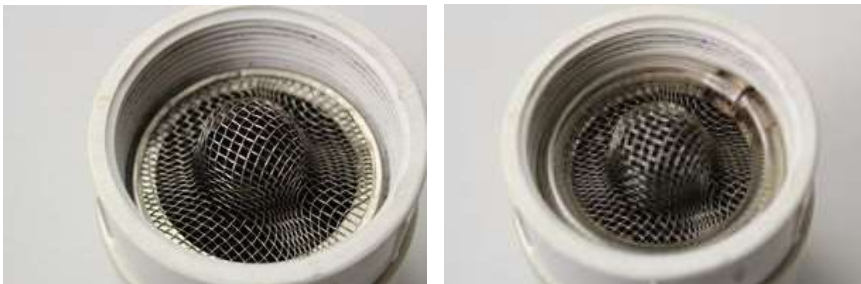

2. Fill 1/4 cup of carbon into the filter just underneath the thread as shown in the picture below.

Do NOT over- or under-fill the carbon!

If you overfill, the sieve will not fit properly on top anymore. If you underfill, there won't be enough carbon in the filter, so the carbon particles rub together, producing large amounts of carbon dust. This is not dangerous, since some people even consume carbon for "internal cleanses", but your fountain water will be a black mess.

3. Insert sieve and seal ring.

4. Rinse under a faucet for 30 seconds until the carbon dust is rinsed out (so water runs clear).

5. Screw the cap on and connect pump and spout

Wash cartridge with mild detergent or vinegar solution or put it in your dishwasher and change carbon every 2 to 4 weeks or as needed.

Carbon is available at: <http://www.bulkreefsupply.com/store/3-pounds-gallon-special-grade-bituminous-aquarium-carbon.html>, or in the aquarium section of your pet store.
